Airbnb Dataset

Since 2008, guests and hosts have used Airbnb to expand on traveling possibilities and present a more unique, personalized way of experiencing the world. Today, Airbnb became one of a kind service that is used and recognized by the whole world. Data analysis on millions of listings provided through Airbnb is a crucial factor for the company. These millions of listings generate a lot of data - data that can be analyzed and used for security, business decisions, understanding of customers' and providers' (hosts) behavior and performance on the platform, guiding marketing initiatives, implementation of innovative additional services and much more.

This dataset has around 49,000 observations in it with 16 columns and it is a mix between categorical and numeric values.

Dataset Summary

- ID -- ID is Dataset's Unique Identifier, which has been store as a integer datatype in our Airbnb Dataset.
- Name In the Name Column there is room title or room name or it can be hotel name preset as a
 object(string) datatype.
- Host ID In the host id column there is unique id or number present which belongs to each host.
- Host name basically in the host name column all the host names present as the string datatype.
- Neighbourhood Group In the neighbourhood group Column all the Group name of neighbourhood prenent as a string datatype.
- Neighbourhood -- In the neighbourhood column all the neighbourhood name present as a string datatype.
- Latitude -- Latitude is the measurement of distance north or south of the Equator. And the latitude is
 present as float data type.
- Longitude -- Longitude is the measurement east or west of the prime meridian. And the longitude is also present as a float data type.

- Room Type -- In the room type column different room types present like private room, shared room as a string datatype.
- Price -- price column consist the price of the neighbourhoods or rooms as a integer datatype.
- Minimum nights -- how many nights guest or host stay in the room that information store in minimun nights column as a integer datatype.
- Number of reviews -- Till the today how many reviews that host or room get that information store in the number of reviews column as a integer datatype.
- Last review -- In the last review column the recent review is store which has been given recently.
- Reviews per month -- In the review per month column how many reviews got within a month that information store month wise as float datatype.
- Calculated host listings count -- in this column listings count is present as a integer datatype.
- availability 365 -- In the availability 365 column whether the rooms is available or not that kind of information store as a integer datatype.

Exploratory Data Analysis

Exploratory Data Analysis (EDA) is an approach to analyze the data using visual techniques. It is used to discover trends, patterns, or to check assumptions with the help of statistical summary and graphical representations. with the help of statistical summary and graphical representations.

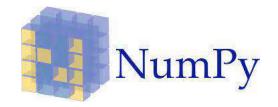

EDA is primarily used to see what data can reveal beyond the formal modeling or hypothesis testing task and provides a provides a better understanding of data set variables and the relationships between them.

Required packages

- ✓ Pandas
- ✓ Numpy
- ✓ Matplotlib
- ✓ Seaborn

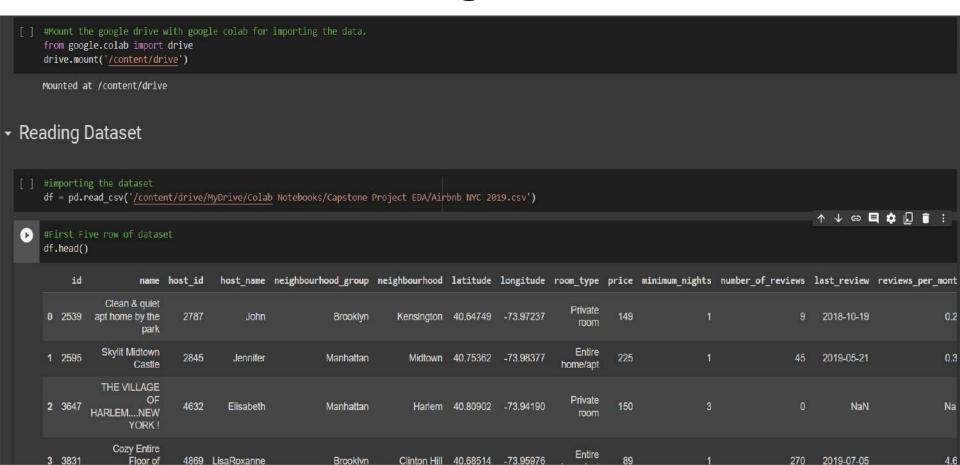

Reading Dataset

Pandas Functions

read_csv(): read csv pandas function help us to load our dataset into notebook.

head(): head function shows us top 5 records of our dataset

tail(): unlike head() function tail function shows last 5 record of dataset

info(): info function gives us all column name with datatype information.

describe(): describe function gives us statistical summary of dataset.

isna(): isna function gives us null value information like which column having how many null values.

nunique(): nunique function gives us the values which are non unique.

Univariate Analysis

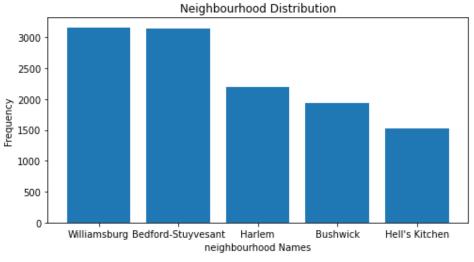

Univariate analysis is the simplest form of analyzing data. "Uni" means "one", so in other words your data has only one variable.

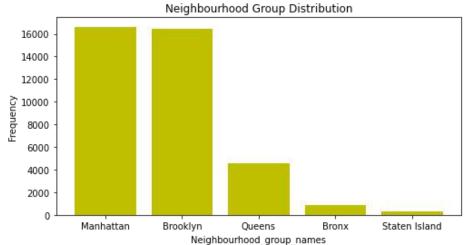

Univariate analysis is a basic kind of analysis technique for statistical data. Here the data contains just one variable and does not have to deal with the relationship of a cause and effect.

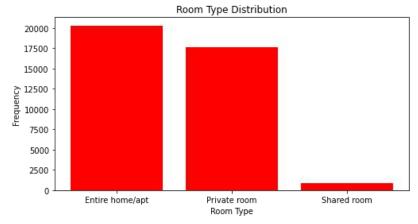

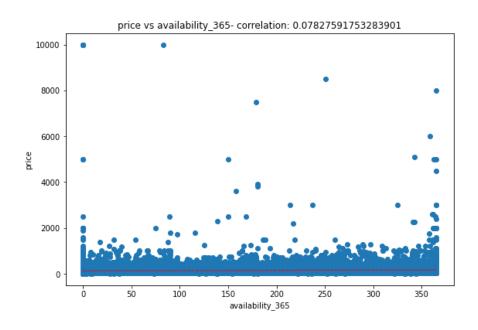

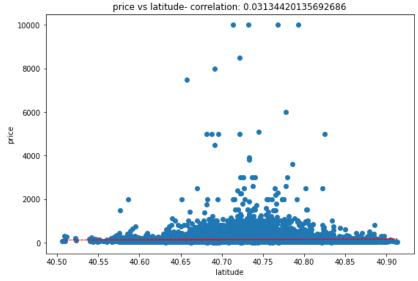

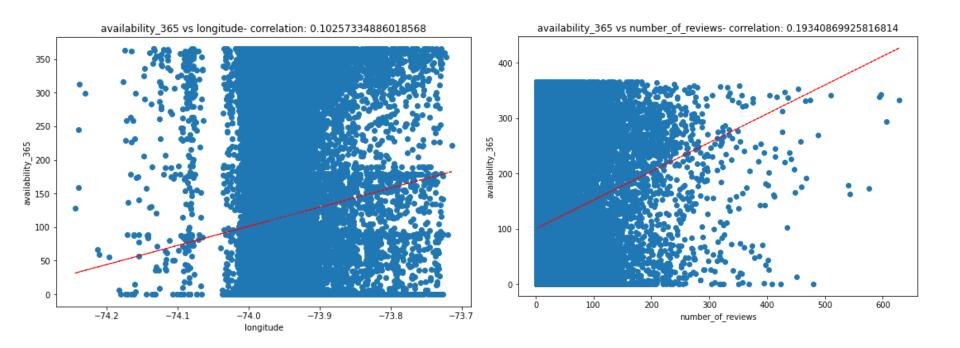

Bivariate Analysis

Bivariate analysis is one of the statistical analysis where two variables are observed. One variable here is dependent while the other is independent. These variables are usually denoted by X and Y.

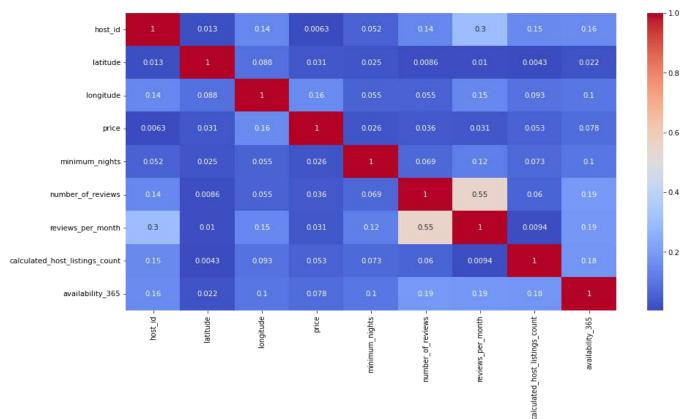

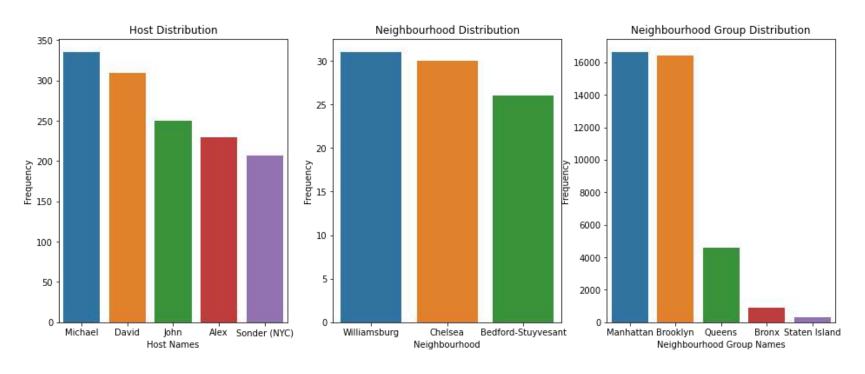

Multivariate Analysis

Multivariate analysis of variance (MANOVA) is used to measure the effect of multiple independent variables on two or more dependent variables.

ΑI

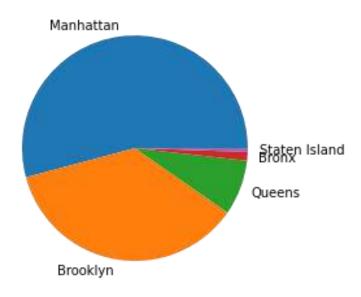

What can we learn about different hosts and areas.

From the above analysis we get to know that all the top hosts are present in Williamsburg Neighbourhood and Manhattan Neighbourhood Group.

ΑI

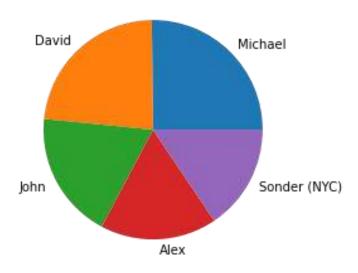

What can we learn from prediction.

From the above price analysis we get to know that the Manhattan Neighbourhood group has highest price than other neighbourhood Groups.

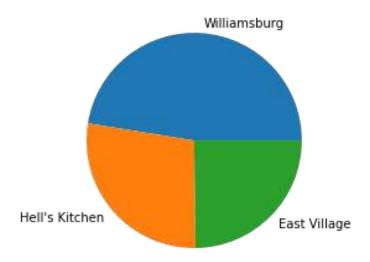

Which hosts are the busiest and why.

From the above graph we get to know that the Michael and david is busiest host than others becouse they are engage with more Neighbourhood Groups and Neighbourhoods and that's the reason behind it.

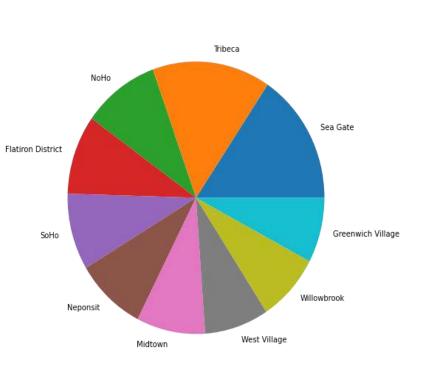

Is there any noticeable difference of traffic among different areas and what could be the reason for it?

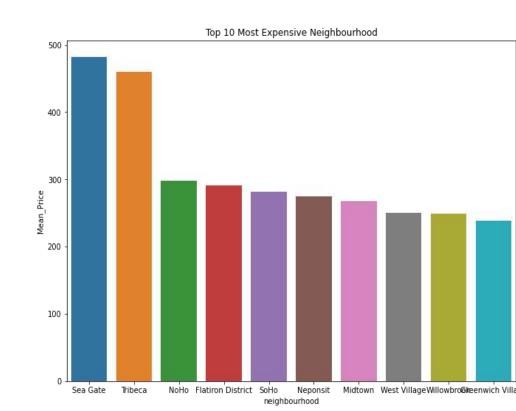

There is difference among the Neighbouhood reviews the reason behind it could be the price and quality provided by the host.

Top 10 Most Expensive Neighbourhood.

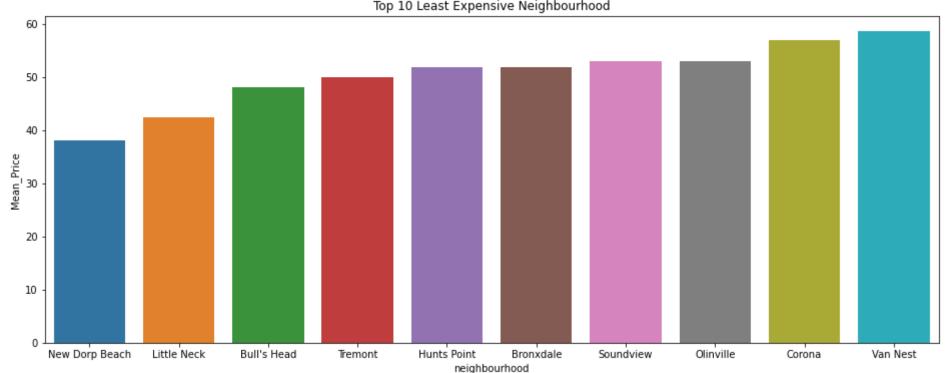

Top 10 Least Expensive Neighbourhood.

Top 10 Least Expensive Neighbourhood

Conclusion

- ➤ In this Exploratory Data Analysis we analyse the data of Airbnb with several key features such as price, neighbourhood, neighbourhood Group, Room type, number of reviews, etc.
- ❖ We obtain price and neighbourhood relationship i.e., Manhattan is the most expensive airbnb region when we compare the other neighbourhood group. On the other hand the least expensive is region in Bronx.
- same analysis we did for the neighbourhood and through out that analysis we get to know that the most expensive neighbourhood is sea gate and the other hand the least expensive is new dorp Beach.
- Another analysis is conducted by using room type. The results show that the entire home/apt type is more preferable and the others are private room and shared room, respectively.
- In the host analysis we found that the Michael and David are the most busiest host.
- In the top host analysis we get to know that the top host are in Manhattan Neighbourhood Group and in williamsburg Neighbourhood.
- from the heatmap we get to know that the there is corelation between number of reviews and reviews per month
- ❖ Number of reviews are also investigated to find which neighborhoods take the most review according to the neighborhood group.
